README

Project's Title - Bid4Clothes

Project Description

Bid4Clothes is a website that allows users to auction off their items and have other users bid and try to buy them. The website allows users to create their own auction, bid on auctions, search for items, create alerts for when an item that would potentially interest them appears on the market, and more! We also have customer reps that can help users if they ever have a problem with our site. All the user has to do is contact support and they will answer any questions or they can check our frequently asked questions page. Customer reps can also modify or remove auctions, bids, and user accounts. We also have an admin that is able to create new customer rep accounts and generate sales reports. We also have a demo video attached to this project to see everything being demonstrated!

How to Run the Project

Other than following the instructions that were already given for this project on the setup and execution of it, you need to make sure that your userid and password are correct in the following files, "ApplicationDB.java" and "questionsConfirmation.jsp", to make sure you are connected to the local database or else it will not run correctly.
